# NYS Youth Tobacco Use by the Numbers

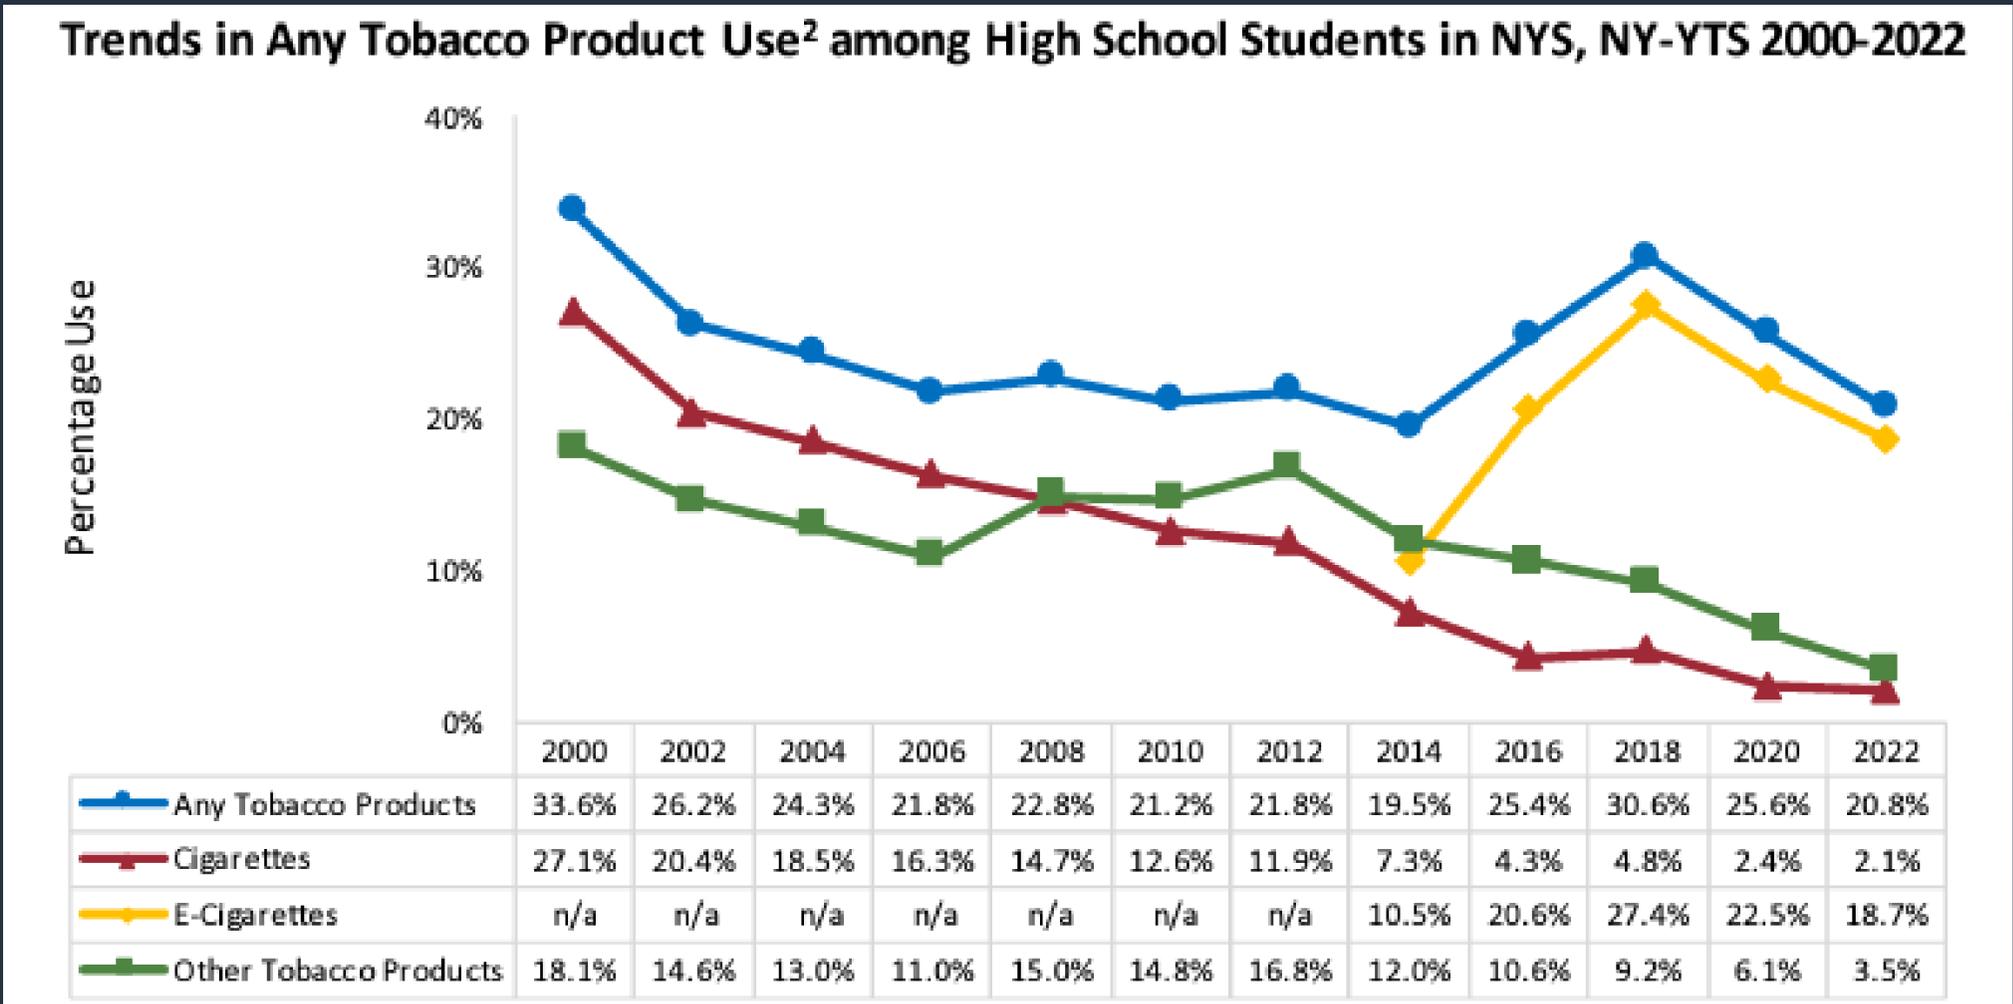

NYS Youth tobacco use rates had been in steady decline for 15 years

- Youth cigarette use 2.1% is at its lowest level since it has been tracked
- Use of other tobacco products including cigars, chew tobacco is also at all time lows

Unfortunately, that progress was upended in 2014 with the explosion of e-cigarettes or vapes.

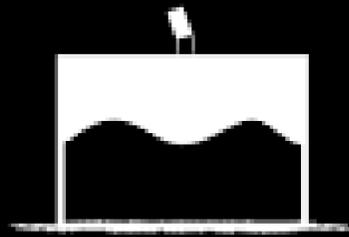

- From 2014-2018 youth e-cigarettes use increased by 161%.
- Youth tobacco use rates increased by 57%

Almost two decades worth of progress reducing youth tobacco use was wiped out in 4 years. Thankfully through Public Health and legislative efforts youth tobacco use rates are again declining

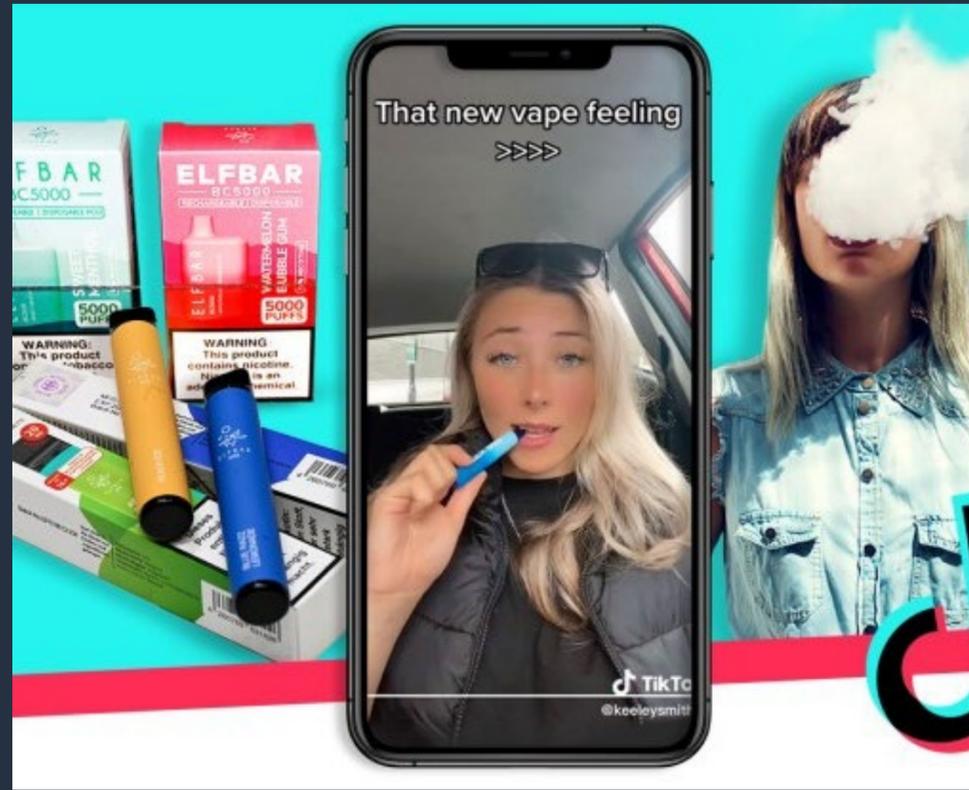

Public Health continues to fight to reduce the impacts of tobacco and nicotine on your youth and communities, but it is an uphill battle and resources remain limited. Funding and legislative support are vital to achieving positive outcomes. Tar Wars is just one example of that support.

Most e-cigarettes contain nicotine, which is highly addictive. Nicotine can harm the parts of an adolescent's brain that control attention, learning, mood, and impulse control.

THE AVERAGE AGE OF A NEW  
SMOKER IN NEW YORK STATE IS  
**13 YEARS OLD**

E-cigarette marketing, the availability of flavored products, social influences, and the effects of nicotine can influence youth to start or continue vaping.

Acute nicotine exposure can be toxic. Children and adults have been poisoned by swallowing, breathing, or absorbing vaping liquid through their skin or eyes. More than 80% of calls to U.S. poison control centers for e-cigarettes are for children less than 5 years old.
